They Can't Tell You How They're Feeling...

The Qest4 System Can.

Functional Medicine

More than 70 percent of animals in any general practice suffer from functional disturbances. Simply speaking, a functional disturbance occurs when no specific tissue or organ damage can be identified by conventional lab work or other pathological diagnostics, yet the animal still experiences a myriad of symptoms.

Functional medicine helps detect and identify these energetic and regulatory disturbances. Functional disturbances can be detected early — even from the very beginning of a pre-clinical phase (when you display symptoms, but no one can identify their cause).

Disease does not begin with pathology, but with a pre-clinical phase. Functional disturbances occur when a living organism can no longer compensate adequately for changes in the environment.

Environmental changes include both internal conditions of the body and external circumstances.

Ideally, it would make good sense to assess an animal using functional evaluation methods and treatment protocols. These methods have shown effective in not only helping to identify and correct pre-clinical disorders and symptomology, but also in reducing or even reversing morphological and pathological deterioration.

Functional medicine is intended to bridge the existing diagnostic and therapeutic gaps. Backed by over 40 years of research, this technology clearly continues to deliver life-changing results. Economically, considerable time and substantial amounts of money could be saved simply by taking advantage of the benefits of this powerful technology in the emerging field of functional medicine.

Testing Process

Using DNA samples or by using the electrodes a micro-amp current (energy pattern) is sent through the DNA sample or if using the electrodes through the energetic pathways known as meridians. The response to these energetic patterns allow us to assess the functional status of the animal. This method of testing has been validated using radioactive isotope imaging and has proven through the years to be very effective in helping animals and humans.

The amount of current that passes through the cellular structure reveals the functional status of the tissues being tested. Because the assessment is based on defined parameters of health, any deviation from this standard can be readily detected. This allows us to see a true picture of how the body is actually functioning on an energetic level.

Once the system has identified the energetic disresonance, it will then pre-screen potential energetic frequencies to balance the disturbance. In doing this the system sends representative electromagnetic signatures and measures the response to see if it corrects the imbalance.

“This allows us to monitor how you respond to a remedy before it is given.” —Reinhold Voll, M.D., M.Sc.

Nationally and internationally, clients have reported over 80 percent satisfaction with the results of Functional Medicine.

On average, three to twelve visits are needed to fully achieve an energetically balanced position. After each visit, you should notice positive changes in health and an overall reduction of symptoms.
